

A Short Report on the Project that I have made

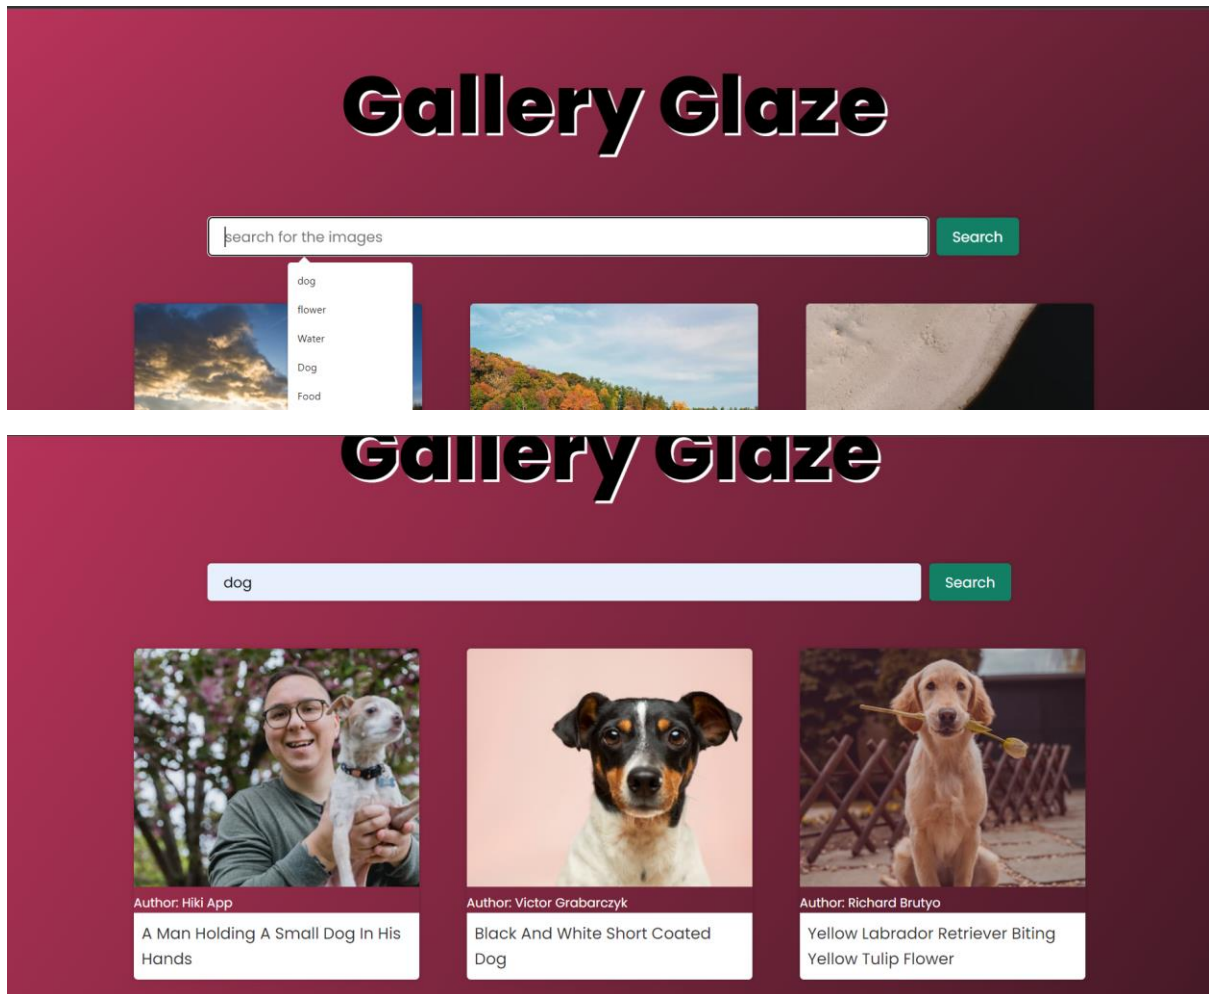

Hiii everyone I have made a small project on **“Picture Gallery”** which is made on HTML, CSS, JAVASCRIPT and API which help us to fetch photos from **“Unsplash.com”** and show it in my websites

The following are the steps I have used for creating this websites:

1. First in index.html I have given heading for our website which is **“Gallery Glaze”** I have linked our css file in the head tag and javascript file in the body tag which will have all the working of the of our website. I have made one text box and 2 button in html in which one button is used for searching and the other button is show more which is used for showing more images which is invisible in the first page of html and it only comes when you search any photo and their working is done in javascript. I have also provided the authors name and a clickable link below the photos in a form of text which tells us the author name and if you click on the text it will take you to that original photo where the photo have come from.
2. I have made a css file which is linked with html file. Css helps to make the UI more attractive with the help of css we make designs which make our UI more attractive I have used the **“POPINS”** fonts with the help of Google Fonts which helps us to change our UI text into any fonts. I have made changes in every important tags and made it attractive and more simple look. With the help of @media I have made my website more responsive.

3. The last and the main file which is the JavaScript file in which I have done the main working of our website where every buttons working every image working is done in the JS file so that we can work with it and modify it accordingly on every tag with the. With the help of JS we have fetched photos from Unsplash.com using its API and the key that was provided by the website. I have a async function which will sync my website with the unsplash photos

Problem faced while making this project

- The pictures which we upload in the websites were having different width and height because of which it was not fitting properly.
- The image was not fetching properly because of the API link was not integrated properly
- Because of different class name given in the Javascript. JS was not able to work properly
